Best 6hp outboard engine

At least once a year, to extend its life and ensure its reliability, give the engine outboard a tuned. Follow these general maintenance steps; consult the owner's manual for specific instructions. Tools: Owner's manual, screwdriver, Phillips head screwdriver, adjustable key, pliers, hammer, coffee maker or other container. Materials: soft cloth, lower unit lubricant, replacement nuts and bolts as required, waterproof marine grease, replacement candles, fuel filter element, car wax, fresh fuel and oil. Buy lubricant, bolts, filters and marine fat in a marine store. Time: about 3 hours. Any outboard brand or size you have, use the maintenance program outlined in your owner's manual. Follow any specific recommendations and use any applicable special procedure. Use only specified lubricants and spare parts; if you use different, you cancel the warranty. Start the pre-set checkout with a visual inspection. With the engine off, remove the cow to expose the power head. Starting from the propeller, at the bottom of the lower unit, examines the engine for signs of loss of lubricants; look around the propeller and under the fill screws on the side of the gear housing. Some oil is normal, but if there's a dark oil stain coming down from the propeller, there might be a leak in the seals behind the propeller. This should be repaired by a qualified outboard mechanic. A poor waste of fuel propeller and increases wear to the lower unit; examine the carefully. Look for small cracks in the blades near the hub, for large niches in the tips of the blade; check if the blades are folded or unlined. If you find any of these conditions, take the propeller to a specialist in propeller or reseller; do not try to repair the damage alone. If the owner's manual recommends periodic modifications of lubricant for the lower unit of the engine, remove the upper and lower fill plugs of the unit and let the lubricant drain into a can of coffee or in another container. Replace the lubricant with the recommended type for the engine. Insert the lube applicator nozzle into the lower filling hole and squirt the lube in the gearbox. When the lubricant begins to exit the upper filling hole, replace the upper plug; then remove the applicator nozzle and replace the lower plug. Remove excess lubricant with a soft cloth. Inspect the lower unit, work upwards, loose or missing nuts or bolts; consult the drawings and follow the precise instructions provided in the owner's manual. Lock screws, nuts and bolts loose; replace the missing hardware with the exact type recommended for use in the engine. In the clamp bracket for transom, lubricate the grease fittings, as indicated in the owner's manual. Lubricate the swivel bracket -- the bearing the motor turns on -- with the waterproof marine grease recommended for your motor; then lubricate wires to transom clamp screw with the same fat. Working the accelerator control on the engine; turn the accelerator by hand or the control lever the control cable of the accelerator is attached to. While working the accelerator control, look at the engine to identify moving parts within the power head. Lubricate all moving parts with the recommended waterproof marine grease for your engine. Move the move lever forward and look for movement within the motor; lubricate all pivot points. Then gently pull the starter cable and watch the screwdriver side that attacks the flywheel at the top of the engine; lubricate the gear and bearing inside. After lubricating the mobile parts inside the power head, disconnect the spark plug wires. Be careful to notice their location exactly so that you will be able to replace them properly. Using an adjustable key, remove each spark plug and replace it with a new type correct for your engine; first hand-seal and then screw-tighten each plug. Be careful not to protrude the thorns; excessive pressure could damage the aluminum cylinder head. At least once a year, to ensure smooth operation, replace the engine fuel filter; use a new filter of the type recommended for the engine. The fuel filter is usually located within the engine cover at the end of the fuel pump motor, or embedded in the fuel pump; check the owner's manual and follow the manufacturer's instructions. Clean any accumulated water and sediment, and replace the filtering element with a new type. Replace the cow on the engine. To protect finishing and prevent corrosion, apply acar wax to cowlings, as directed by the manufacturer. then mix the fuel for the engine, using the proportions of fresh fuel and oil specified in the manual of your owner. mount the engine, in water for testing. Finally, with the motor mounted, start the engine. immediately check a water flow somewhere on the back of the engine; this indicates that the water pump works properly. let the engine heat up for at least 2 minutes and then adjust the jet of the carburetor at low speed, turning the fuel-mix knob on the front of the engine until the engine will be identified smoothly. put the engine on the road and go for a short ride; then idle down and reassemble. if the engine has a minimum adjustment, turn the control until the engine melts smoothly and does not die when moving on. performing this periodic maintenance, you can maintain the outboard engine of the boat in good working conditions. Later, we will describe the specific steps to prepare the outboard engine for storage during the winter. for advice on the care and repair of other types of sports equipment, try the following links: what is the best 6hp outboard motor. what is the best 6hp outboard. what are the best outboard engines
